

AUTOMATIC SINGLE SPEED ELECTRONIC THERMOSTAT

Part No: KLM2150

This fully automatic electronic thermostat has a fast acting contact probe that can be simply inserted against a tube in the radiator matrix. There is no need to cut hoses or break into the cooling system in any way. A special Fastfit probe retainer is provided. The thermostat is fully adjustable to suit all vehicles.

The thermostat comes pre-wired into the fan harness, complete with inline fuse and relay (it even has an input to allow connection to the air-conditioning system where applicable). This will minimise wiring connections to be made when installing. A second output is provided for use with twin fan installations. All wires are clearly colour coded. Once installed, the fan will be switched on and off fully automatically to ensure that the engine temperature rises quickly to the correct operating temperature (fan off) to minimise wear and give an efficient fuel burn for power, economy and extended life of the catalytic converter. Should the ram air effect on the radiator be insufficient to maintain a normal engine temperature at any time (e.g. in traffic jams or on long slow hill climbs), the fan will operate to reduce and stabilise the temperature.

This unit is suitable for controlling single or twin fan systems.
